

4. Employability Skills (26)

Linux Terminal and Github

Duration: 5 Class Days

Points: 100

Objective

Students will create a GitHub account and complete the entire **Terminal Introduction** section of WebTerm Adventure.

WebTerm allows students to practice Linux terminal commands directly in the browser through guided lessons and activities.

Learning Targets

By the end of this assignment, students will be able to:

- Create a professional GitHub account
- Explain the purpose of a terminal interface
- Navigate a Linux file system
- Create, move, rename, copy, and delete files and folders
- Use common command-line tools
- Demonstrate persistence and problem solving when learning new technology

Students will complete all lessons in the **Terminal Introduction** section.

The screenshot shows the first page of a terminal adventure. The header includes the title 'MJ1 Github & Linux Terminal Adventure', a due date of 'Sep 8 at 11:59 PM', and progress statistics: '46/46 Graded', '60.11 / 100 (60%) Average', and '39/46 Students'. The page number '1' is highlighted in the navigation bar. The main content area contains a paragraph explaining the difference between a Command Line Interface (CLI) and a Graphical User Interface (GUI), followed by five numbered questions. The right sidebar shows the submission status 'Submitted: Sep 3 at 12:51 PM', a word count of 269, and an assessment table with a grade of 100% and a status of 'None'. An assignment comment from a user named 'Pierce' is also visible.

CLI stands for **Command Line Interface**, and it's a method of operation by typing text commands. You need to learn specific commands and it takes practice to get used to. But in return, what you can do increases dramatically. GUI stands for **Graphical User Interface**, and it's a method of operation by clicking buttons and icons. The browser is a typical GUI application. While intuitive and easy to understand, you can only perform pre-defined operations. They both help operate a computer, but CLI is more complicated but more free, while GUI is simpler but less free.

2. Which terminal command was easiest for you to learn?
History, which is easy to remember what to type and how to spell it. No other words/commands are necessary, nor any other key binds.

3. Which terminal command was most difficult?
For me, the command of backspacing a word was the most difficult. Not only did it delete tabs-the key bind with tab and backspace did not work originally.

4. Why do software developers use terminals?
Software developers use terminals because they are quick and give more freedom. Typing commands of many sorts allows more freedom, and the limited graphics allow for speed. Also, terminals of all sorts vary by only a little (or not at all).

5. How might terminal skills help you in future technology careers?
The knowledge of using key-binds and knowing commands now will expand my knowledge of terminal for the future. Many jobs will require knowledge of terminal, due to its raw efficiency.

Definitely using the terminal has more leverage and privileges to access computing resources, not only to organize files but to build systems. Great power requires bigger responsibilities.

The screenshot shows the seventh and final page of the terminal adventure. The header is similar to the first page but with updated progress: '46/46 Graded', '60.11 / 100 (60%) Average', and '11/46 Students'. The page number '7' is highlighted. The main content area contains two numbered questions. The right sidebar shows the submission status 'Submitted: Sep 3 at 12:51 PM', a word count of 269, and an assessment table with a grade of 100% and a status of 'None'. An assignment comment from a user named 'Xia Cody' is also visible.

4. One reason software developers use terminals is because giving text commands is much faster. It also allows them to connect to and manage remote servers that do not have a graphical screen.

5. Learning command line skills gives you a deeper understanding of how operating systems work. This could lead to positions in software engineering, cybersecurity, and other jobs where command line skills are used daily.
